### **Cells Compute**

- No survival without computation!
  - Finding food
  - Avoiding predators
- How do they compute?
  - Unusual computational paradigms.
  - Proteins: do they work like electronic circuits? or process algebra?
  - Genes: what kind of software is that?
- Signaling networks
  - Clearly "information processing"
  - They are "just chemistry": molecule interactions
  - But what are their principles and algorithms?
- Complex, higher-order interactions
  - MAPKKK = MAP Kinase Kinase Kinase: that which operates on that which operates on that which operates on protein.

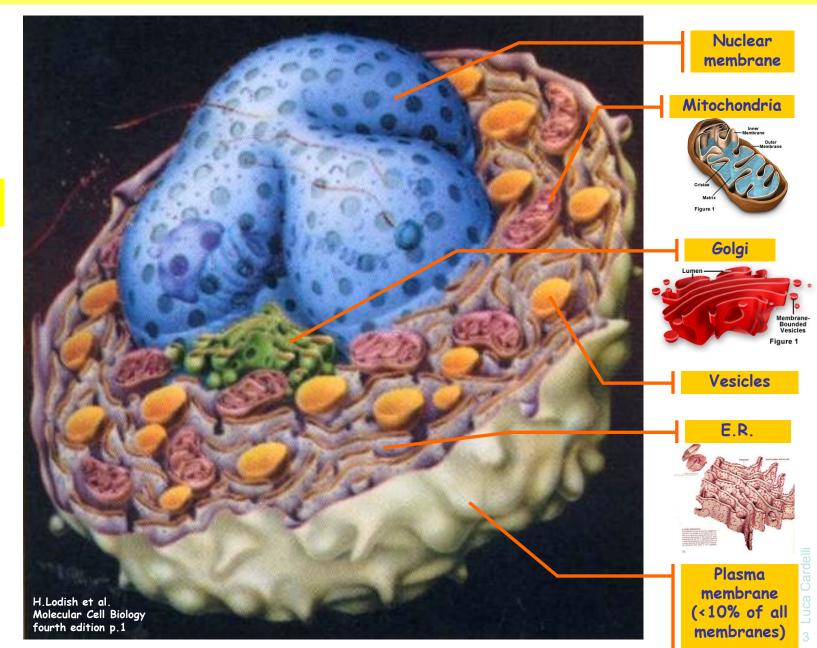

Natl. Acad. Sci. USA, 93, 10078-10083.

### Modeling

- We believe that {petri nets, process algebra, term rewriting, multiagent systems} are {better, complementary} for modeling biological systems than {SBML, Kohn charts, chemical reactions, ODEs}.
- We take a paper from the literature (usually ODEs or chemical reactions) and "code it up" in e.g. Petri nets.
- How do we know that's the "same system"? How do we convince other people that we are doing the "right thing"?

## **Stochastic Collectives**

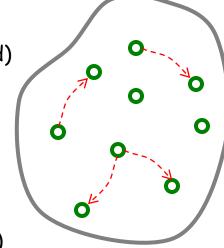

### **Stochastic Collectives**

#### • "Collective":

- A large set of interacting finite state automata:
  - Not quite language automata ("large set")
  - Not quite cellular automata ("interacting" but not on a grid)
  - Not quite process algebra ("collective behavior")
  - Cf. multi-agent systems and swarm intelligence

#### "Stochastic":

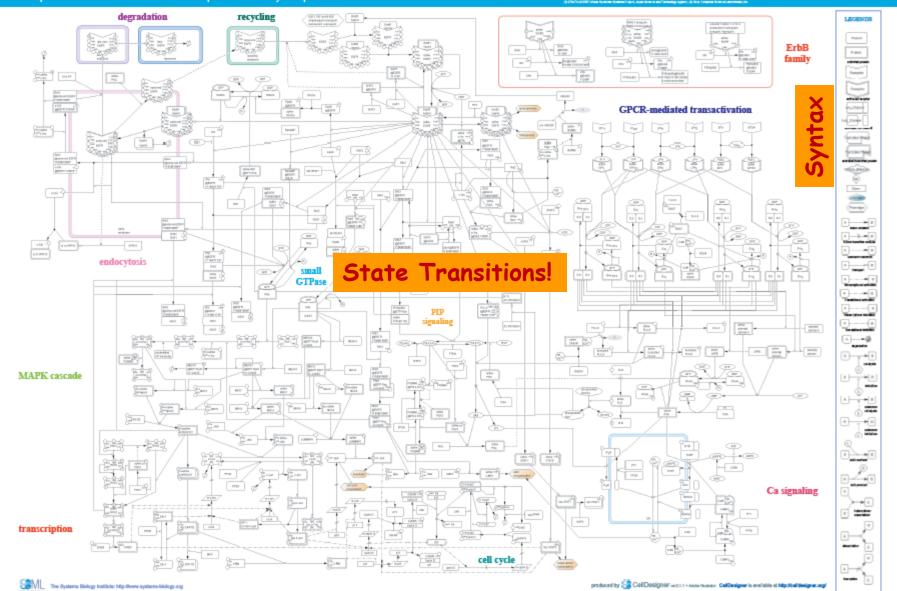

- Interactions have rates
  - Not quite discrete (hundreds or thousands of components)
  - Not quite continuous (non-trivial stochastic effects)
  - Not quite hybrid (no "switching" between regimes)
- Very much like biochemistry
  - Which is a large set of stochastically interacting molecules/proteins
  - Are proteins finite state and subject to automata-like transitions?
    - Let's say they are, at least because:
    - Much of the knowledge being accumulated in Systems Biology is described as state transition diagrams [Kitano].

### Interacting Automata

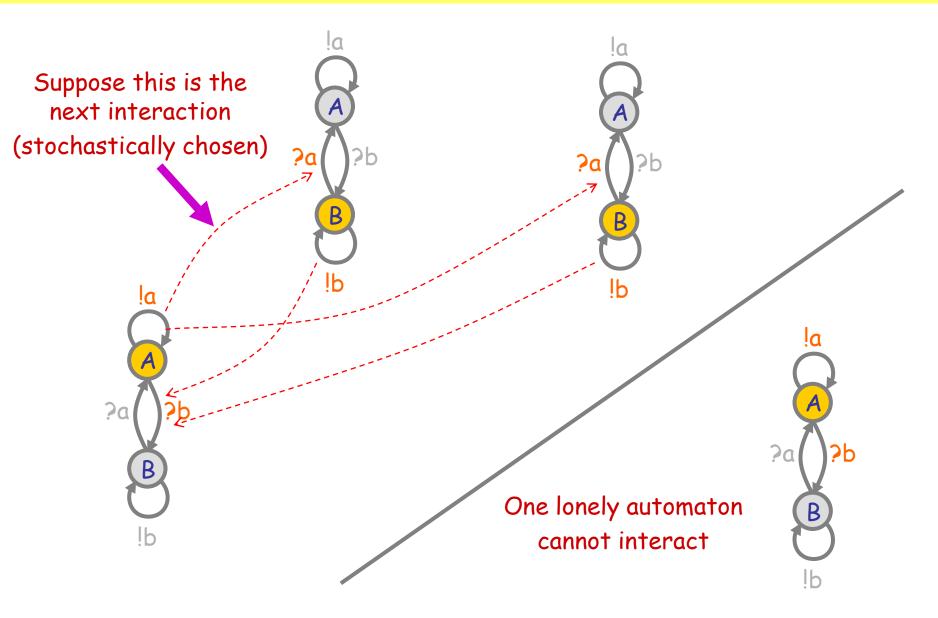

Communicating automata: a graphical FSA-like notation for "finite state restriction-free  $\pi$ -calculus processes". Interacting automata do not even exchange values on communication.

The stochastic version has *rates* on communications, and delays.

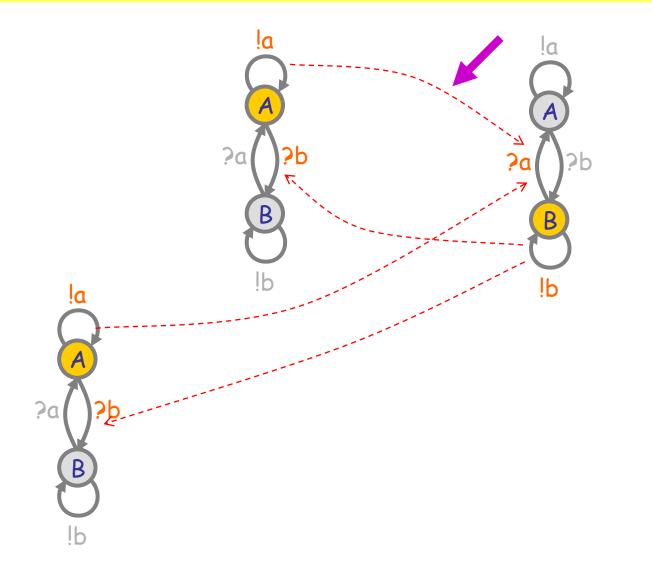

"Finite state" means: no composition or restriction inside recursion. Analyzable by standard Markovian techniques, by first computing the "product automaton" to obtain the underlying finite Markov transition system. [Buchholz] *Interactions* have rates. Actions DO NOT have rates.

### Chemistry vs. Automata

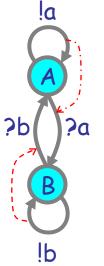

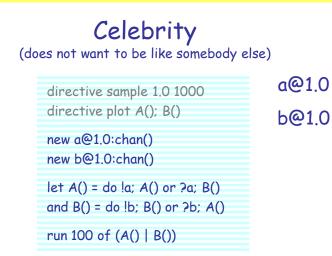

A Petri-Net-like representation. Precise and dynamic A compositional graphical representation (precise, but not modular, scalable, or maintainable. A compositional graphical representation (precise, dynamic and modular) and the corresponding calculus.

uca Cardelli

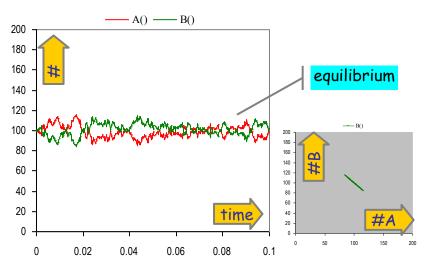

## **Groupies and Celebrities**

### **Groupies and Celebrities**

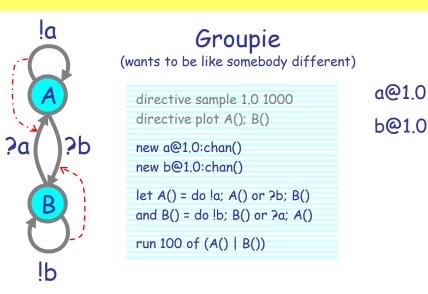

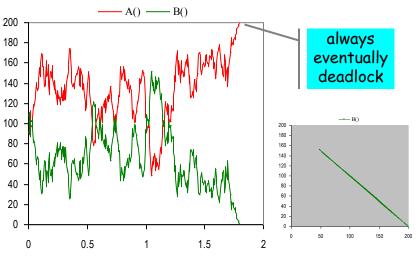

#### A stochastic collective of celebrities:

Stable because as soon as a A finds itself in the majority, it is more likely to find somebody in the same state, and hence change, so the majority is weakened.

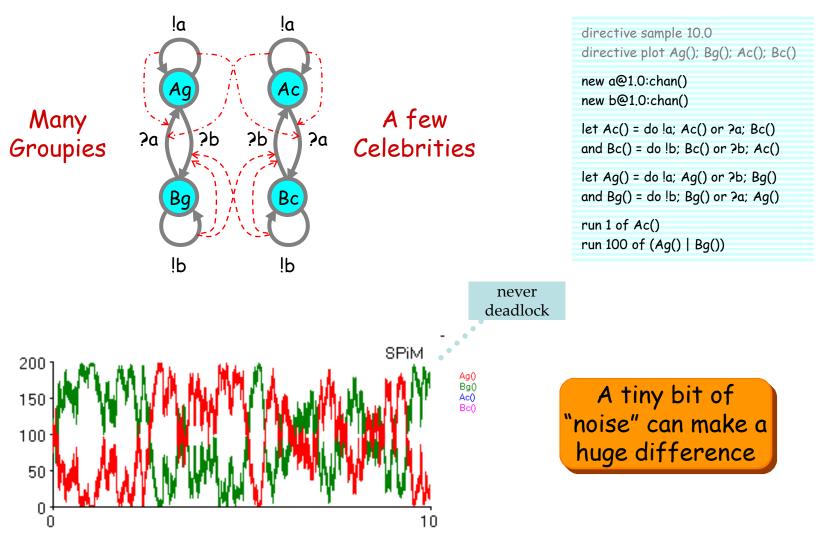

#### A stochastic collective of groupies:

Unstable because within an A majority, an A has difficulty finding a B to emulate, but the few B's have plenty of A's to emulate, so the majority may switch to B. Leads to deadlock when everybody is in the same state and there is nobody different to emulate. 2007-10-26

### Both Together

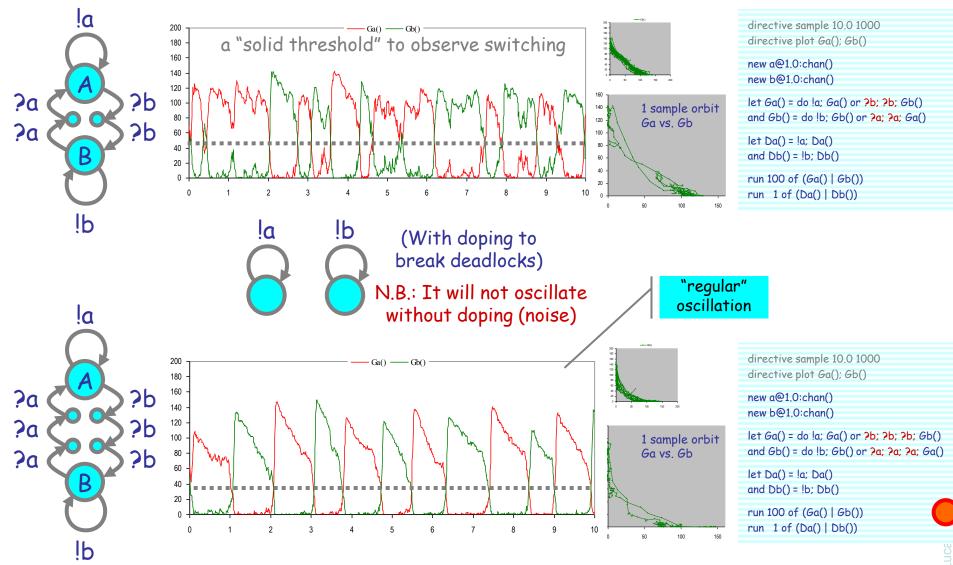

A way to break the deadlocks: Groupies with just a few Celebrities

#### Regularity can arise not far from chaos

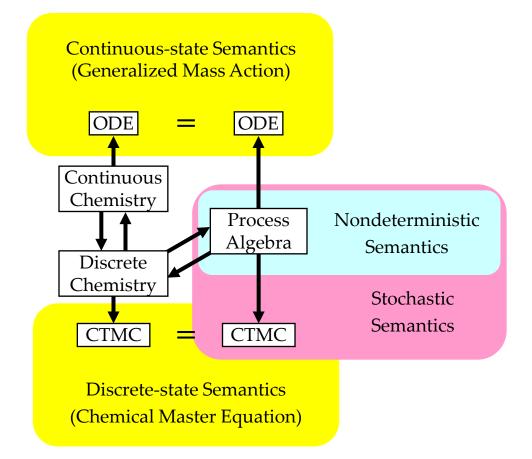

### Hysteric Groupies

We can get more regular behavior from groupies if they "need more convincing", or "hysteresis" (history-dependence), to switch states.

# Semantics of Collective Behavior

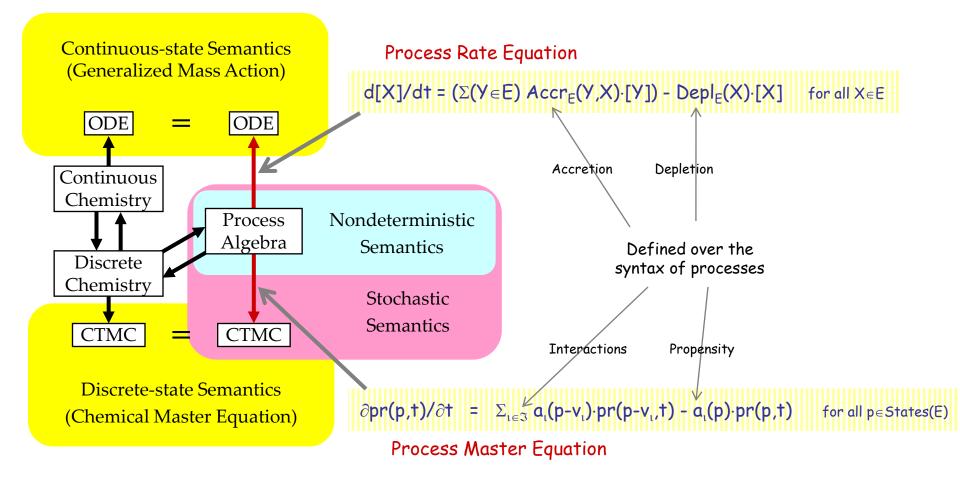

### The Two Semantic Sides of Chemistry

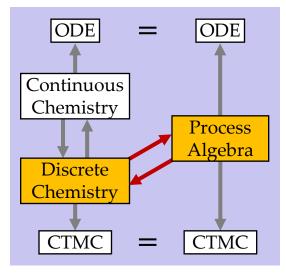

These diagrams commute via appropriate maps.

L. Cardelli: "On Process Rate Semantics" (TCS) L. Cardelli: "A Process Algebra Master Equation" (QEST'07)

### Quantitative Process Semantics

# Stochastic Processes & Discrete Chemistry

### **Chemical Reactions**

$$\begin{array}{cccc} A & \rightarrow^{r} & B_{1} + ... + & B_{n} & (n \ge 0 \\ A_{1} + & A_{2} & \rightarrow^{r} & B_{1} + ... + & B_{n} & (n \ge 0 \\ A + & A & \rightarrow^{r} & B_{1} + ... + & B_{n} & (n \ge 0 \end{array}$$

Unary Reactiond[A]/dt = -r[A]Exponential DecayHetero Reaction $d[A_i]/dt = -r[A_1][A_2]$ Mass Action LawHomeo Reaction $d[A]/dt = -2r[A]^2$ Mass Action Law(assuming  $A \neq B_i \neq A_i$  for all i,j)

#### No other reactions!

JOURNAL OF CHEMICAL PHYSICS

VOLUME 113, NUMBER 1

#### The chemical Langevin equation

Daniel T. Gillespie<sup>a)</sup> Research Department, Code 4T4100D, Naval Air Warfare Center, China Lake, California 93555

Genuinely *trimolecular* reactions do not physically occur in dilute fluids with any appreciable frequency. *Apparently* trimolecular reactions in a fluid are usually the combined result of two bimolecular reactions and one monomolecular reaction, and involve an additional short-lived species.

#### **Chapter IV: Chemical Kinetics** [David A. Reckhow, CEE 572 Course]

... reactions may be either elementary or nonelementary. <u>Elementary reactions</u> are those reactions that occur exactly as they are written, without any intermediate steps. These reactions almost always involve just one or two reactants. ... <u>Non-elementary</u> <u>reactions</u> involve a series of two or more elementary reactions. Many complex environmental reactions are non-elementary. In general, reactions with an overall reaction order greater than two, or reactions with some non-integer reaction order are non-elementary.

### THE COLLISION THEORY OF REACTION RATES

www.chemguide.co.uk

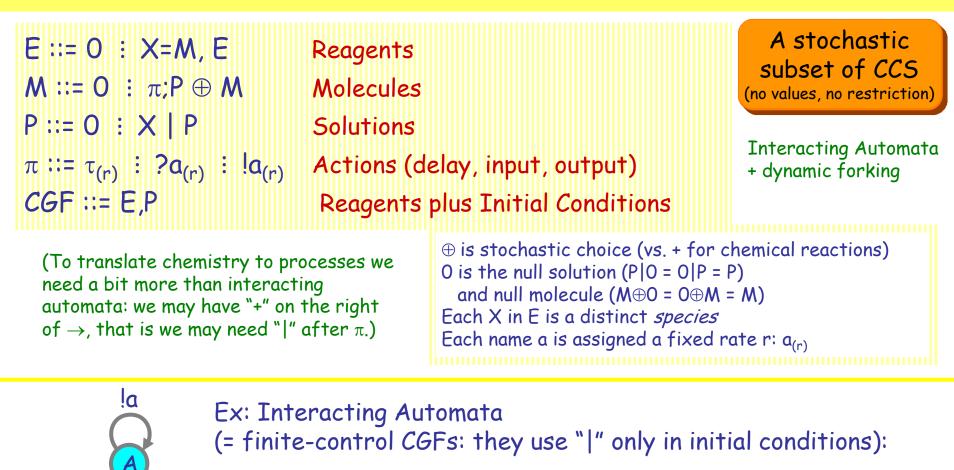

The chances of all this happening if your reaction needed a collision involving more than 2 particles are remote. All three (or more) particles would have to arrive at exactly the same point in space at the same time, with everything lined up exactly right, and having enough energy to react. That's not likely to happen very often!

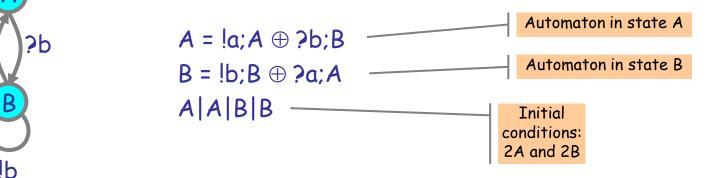

> *Reactions* have rates. Molecules *do not* have rates.

Trimolecular reactions:  $A + B + C \rightarrow^{r} D$ the measured "r" is an (imperfect) aggregate of e.g.:  $A + B \leftrightarrow AB$  $AB + C \rightarrow D$  Enzymatic reactions: S \_ E y P

the "r" is given by Michaelis-Menten (approximated steady-state) laws:  $E + S \leftrightarrow ES$  $FS \rightarrow P + F$ 

### Chemical Ground Form (CGF)

Initial conditions for P:

Ch(P) := P

### **Entangled vs Detangled**

b: A+B  $\rightarrow^{r}$  A+B' c: A+C  $\rightarrow^{r}$  A+C'

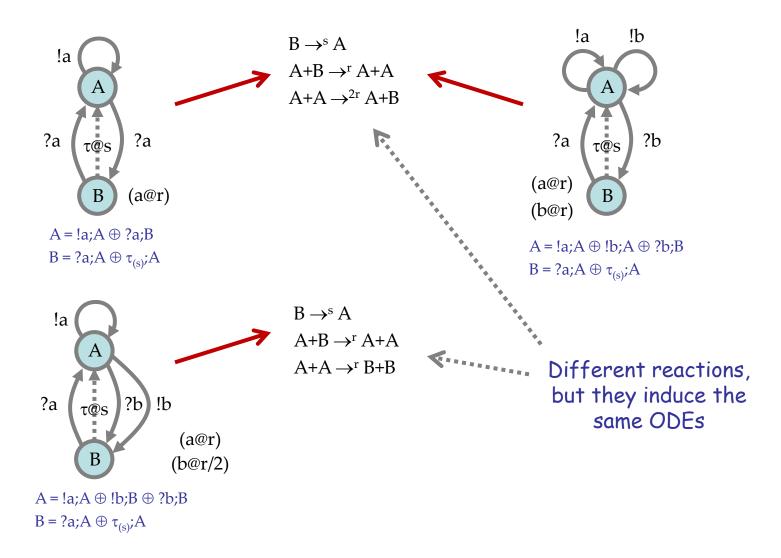

Entagled: Two reactions on one channel Detangled: Two reactions on two separate channels

We need a semantics of automata that identifies automata that have the "same chemistry". No process algebra equivalence is like this!

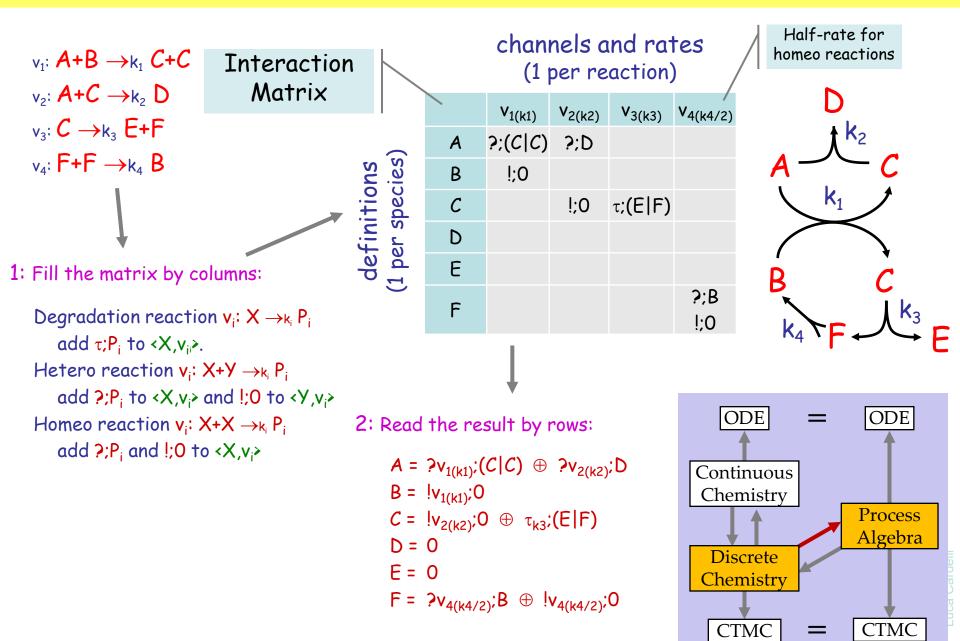

Detangled processes are in simple correspondence with chemistry.

### Same Semantics

Could chemistry itself be that semantics? No: different sets of reactions can have the same behavior!

### From Reactions to Reagents (by example)

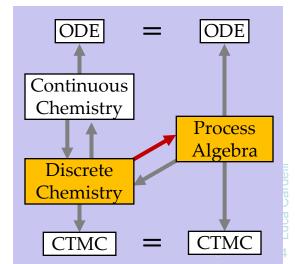

### From Reactions to Reagents: Pi(C)

v:  $X \rightarrow^r Y_1 + ... + Y_n + 0$ Unary Reactionv:  $X_1 + X_2 \rightarrow^r Y_1 + ... + Y_n + 0$ Binary Reaction

From uniquely-labeled (v:) chemical reactions C to a CGF Pi(C):

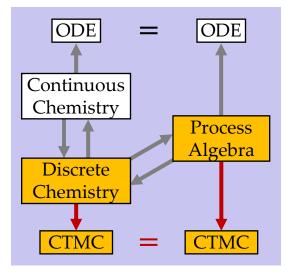

$$\begin{aligned} \mathsf{Pi}(\mathcal{C}) &= \{ (\mathsf{X} = \oplus((\mathsf{v}: \mathsf{X} \to^{\mathsf{k}} \mathsf{P}) \in \mathcal{C}) \text{ of } (\tau_{(\mathsf{k})}; \mathsf{P}) & \oplus \\ & \oplus((\mathsf{v}: \mathsf{X} + \mathsf{Y} \to^{\mathsf{k}} \mathsf{P}) \in \mathcal{C} \text{ and } \mathsf{Y} \neq \mathsf{X}) \text{ of } (\mathsf{P}_{\mathsf{V}_{(\mathsf{k})}}; \mathsf{P}) & \oplus \\ & \oplus((\mathsf{v}: \mathsf{Y} + \mathsf{X} \to^{\mathsf{k}} \mathsf{P}) \in \mathcal{C} \text{ and } \mathsf{Y} \neq \mathsf{X}) \text{ of } (!\mathsf{v}_{(\mathsf{k})}; \mathsf{O}) & \oplus \\ & \oplus((\mathsf{v}: \mathsf{X} + \mathsf{X} \to^{\mathsf{k}} \mathsf{P}) \in \mathcal{C}) \text{ of } (\mathsf{P}_{\mathsf{V}_{(\mathsf{k}/2)}}; \mathsf{P} \oplus !\mathsf{v}_{(\mathsf{k}/2)}; \mathsf{O}) & ) \\ & \oplus: (\mathsf{I}, \mathsf{X} \times \mathsf{I}, \mathsf{X} \text{ is a species in } \mathcal{C} \} \end{aligned}$$

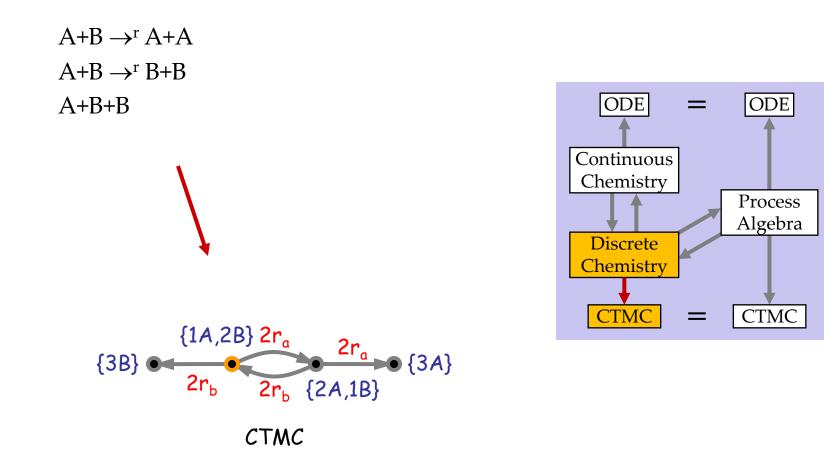

### Some Syntactic Properties

- C and Ch(Pi(C)) have the same reactions
  - (and their reaction labels are in bijection)
- Def: E is detangled if each channel appears once as ?a and once as !a.
- If C is a system of chemical reactions then Pi(C) is detangled.
  - (hence chemical reactions embed into a subclass of CGFs)
- Hence for any E, we have that Pi(Ch(E)) is detangled.
  - (E and Pi(Ch(E)) are "equivalent" CGFs, but that has to be shown later)
- Def: E,P is automata form if "|" occurs only (other than "|0") in P.
- Def: Detangle(E) is defined from Pi(Ch(E)) by replacing any occurrence pairs  $2a_{(r)}$ ; (X|Y|0) and  $1a_{(r)}$ ; 0 with  $2a_{(r)}$ ; (X|0) and  $1a_{(r)}$ ; (Y|0).
- If E is in automata form then Detangle(E) is (detangled and) in automata form
   (but Pi(Ch(E)) may not be)

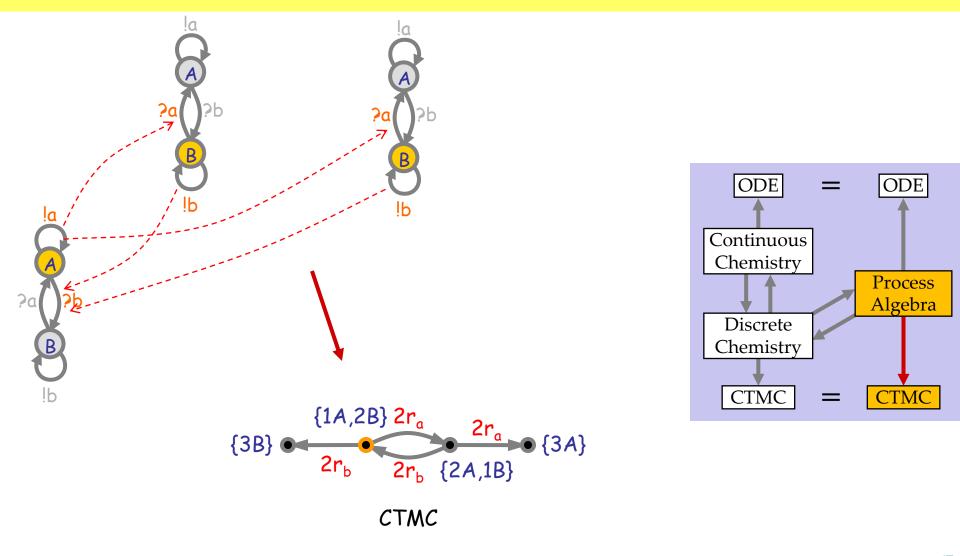

# Discrete-State Semantics

### **Discrete Semantics of Reactions**

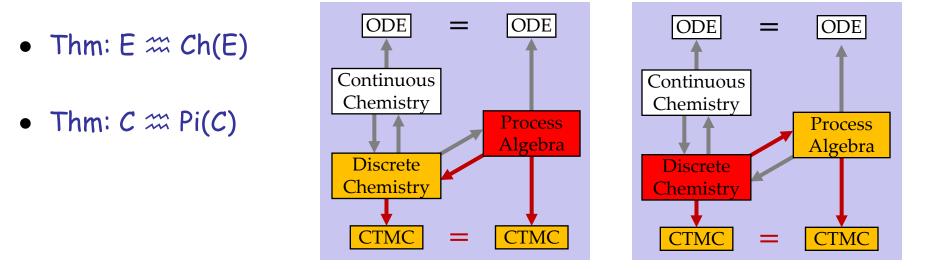

### **Discrete Semantics of Reagents**

# Discrete State Equivalence

• Def: *m* is equivalent CTMC's (isomorphic graphs with same rates).

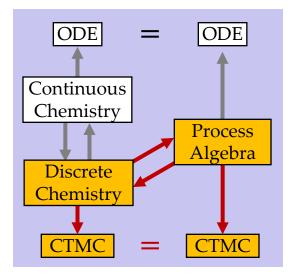

- For each E there is an E'  $\approx$  E that is detangled (E' = Pi(Ch(E)))

# Process Algebra = Discrete Chemistry

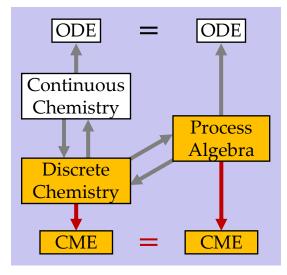

This is enough to establish that the process algebra is really faithful to the chemistry.

But CTMC are not the "ultimate semantics" because there are still questions of when two different CTMCs are actually equivalent (e.g. "lumping").

The "ultimate semantics" of chemistry is the *Chemical Master Equation* (derivable from the *Chapman-Kolmogorov equation of the CTMC*).

# Master Equation Semantics

# **Chemical Master Equation**

#### Chemical Master Equation for a chemical system C

 $\frac{\partial pr(\sigma,t)}{\partial t} = \sum_{i \in 1..M} a_i(\sigma - v_i) \cdot pr(\sigma - v_i,t) - a_i(\sigma) \cdot pr(\sigma,t)$ Reactions
Proper

"The change of probability at time t of a state is: the sum over all possible (kinds of) reactions of: the probability at time t of each state leading to this one times the propensity of that reaction in that state minus the probability at time t of the current state times the propensity of each reaction in the current state"

 $\sigma \in 1..N \rightarrow Nat$  is a *state* of the system with N chemical species

 $pr(\sigma,t) = Pr\{\chi(t)=\sigma \mid \chi(0)=\sigma_0\}$  is the conditional probability of the system  $\chi$ being in state  $\sigma$  at time t given that it was in state  $\sigma_0$  at time 0.

There are 1. M chemical reactions.

v, is the state change caused by reaction  $\iota$  (as a difference)

 $a_{\iota}(\sigma) = c_{\iota} \cdot h_{\iota}(\rho)$  is the *propensity* of reaction  $\iota$  in state  $\sigma$ , defined by a base reaction rate and a state-dependent count of the distinct combinations of reagents. (It depends on the kind of reactions.)

for all  $\sigma \in States(C)$ 

Propensity

# **Process Algebra Master Equation**

#### Process Master Equation for a system of reagents E

"The change of probability at time t of a state is: the sum over all possible (kinds of) interactions of: the probability at time t of each state leading to this one times the propensity of that interaction in that state minus the probability at time t of the current state times the propensity of each interaction in the current state"

 $\frac{\partial pr(\rho,t)}{\partial t} = \sum_{\iota \in \mathfrak{I}} a_{\iota}(\rho - v_{\iota}) \cdot pr(\rho - v_{\iota},t) - a_{\iota}(\rho) \cdot pr(\rho,t)$ Interactions
Proper

 $\rho \in species(E) \rightarrow Nat$  is a state of the system

 $pr(\rho,t) = Pr\{\chi(t)=\rho \mid \chi(0)=\rho_0\}$  is the conditional probability of the system  $\chi$ being in state  $\rho$  at time t given that it was in state  $\rho_0$  at time 0.

 $\mathfrak{I}$  is the finite set of *possible interactions* arising from a set of reagents E. (All  $\tau$  and all 2a/la pairs in E)

 $v_{1}$  is the state change caused by interaction  $\iota$  (as a difference)

 $a_{i}(\rho) = r_{i} \cdot h_{i}(\rho)$  is the *propensity* of interaction i in state  $\rho$ , defined by a base rate of interaction and a state-dependent count of the distinct combinations of reagents. (It depends on the kind of interaction.)

for all  $\rho \in States(E)$ 

Propensity

## ... details

#### Process Master Equation for Reagents E

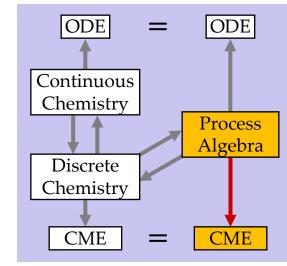

### $\partial pr(p,t)/\partial t = \sum_{i \in \Im} a_i(p-v_i) \cdot pr(p-v_i,t) - a_i(p) \cdot pr(p,t)$ for all $p \in States(E)$

 $pr(p,t) = Pr\{S(t)=p \mid S(0)=p_0\}$  is the conditional probability of the system being in state p (a multiset of molecules) at time t given that it was in state  $p_0$  at time 0.

$$\label{eq:states} \begin{split} \mathfrak{T} &= \{\{X.i\} \text{ $s.t.$ E.X.i = $\tau_{(r)}$; Q} \} \cup \\ &\{\{X.i, Y.j\} \text{ $s.t.$ E.X.i = $?n_{(r)}$; Q and E.Y.j = $!n_{(r)}$; R} \} \\ &\text{ is the set of possible interactions in E} \end{split}$$

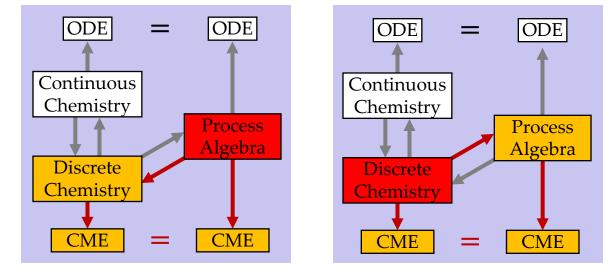

v<sub>i</sub> is the state change caused by an interaction  $\iota \in \mathfrak{J}$ . v<sub>i</sub> = -X+Q if  $\iota = \{X.i\} s.t. E.X.i = \tau_{(r)}; Q$ v<sub>i</sub> = -X-Y+Q\_R if  $\iota = \{X.i, Y.j\} s.t. E.X.i = ?n_{(r)}; Q$  and E.Y.j =  $!n_{(r)}; R$ 

 $a_{\iota}$  is the propensity of interaction  $\iota$  in state p. Here  $p^{\#\times}$  is the number of X in p. $a_{\iota}(p) = r \cdot p^{\#\times}$ if  $\iota = \{X.i\} s.t. E.X.i = \tau_{(r)}; Q$  $a_{\iota}(p) = r \cdot p^{\#\times} \cdot p^{\#\vee}$ if  $\iota = \{X.i, Y.j\} s.t. X \neq Y$  and  $E.X.i = ?a_{(r)}; Q$  and  $E.Y.j = !a_{(r)}; R$  $a_{\iota}(p) = r \cdot p^{\#\times} \cdot (p^{\#\times}-1)$ if  $\iota = \{X.i, X.j\} s.t. E.X.i = ?a_{(r)}; Q$  and  $E.X.j = !a_{(r)}; R$

# GMA ≠ CME

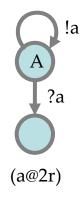

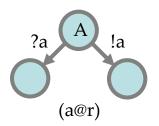

#### $A+A \rightarrow^{2r} A =? A+A \rightarrow^{r} 0$

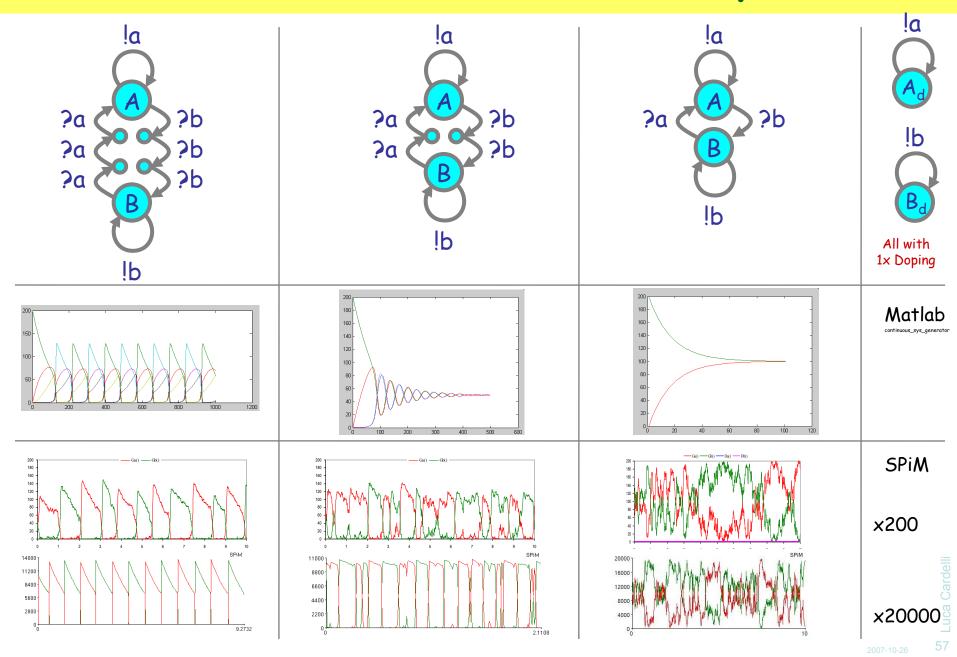

#### ... as Automata

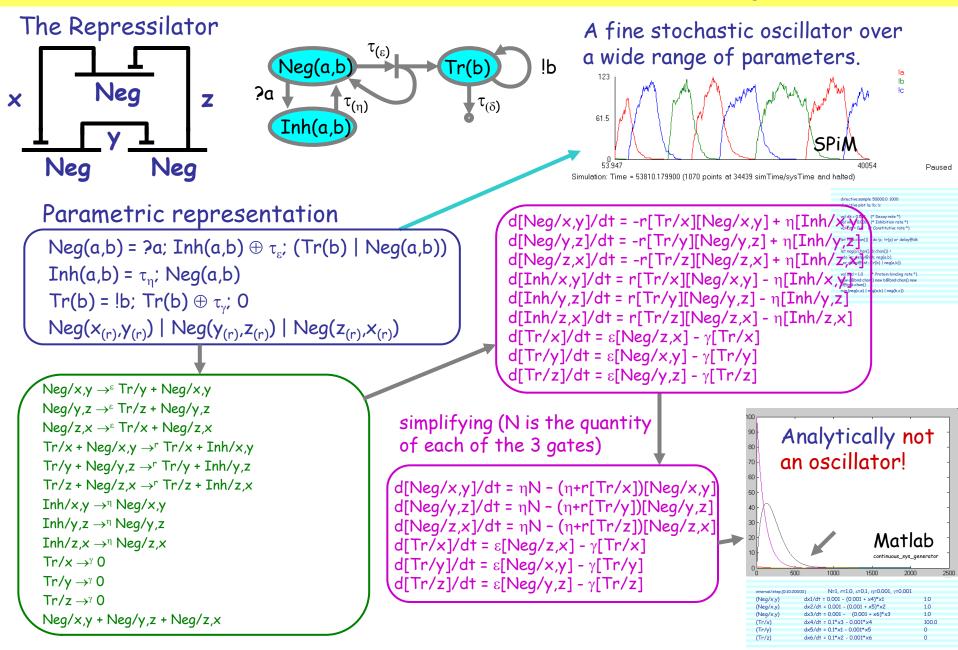

### Continuous vs. Discrete Groupies

# And Yet It Moves

R.Blossey, L.Cardelli, A.Phillips: Compositionality, Stochasticity and Cooperativity in Dynamic Models of Gene Regulation (HFSP Journal)

# Conclusions

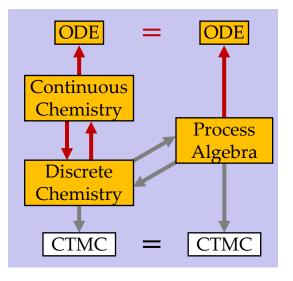

## Conclusions

- Compositional models
  - Accurate (at the "appropriate" abstraction level).
  - Manageable (so we can scale them up by composition).
  - Executable (stochastic simulation).
- Analysis techniques
  - Mathematical techniques: Markov theory, Chemical Master Equation, and Rate Equation
  - Computing techniques: Abstraction and Refinement, Model Checking, Causality Analysis.
- Many lines of extensions
  - Parametric processes for model factorization
  - Polyautomata for Bio-Chemistry: complexation and polymerization
  - Ultimately, rich process-algebra based modeling languages.
- Quantitative techniques
  - Important in the "real sciences".

# Continuous-State Semantics (long version)

# The "Type System" of Chemistry

The International System of Units (SI) defines the following physical units, with related derived units and constants; note that *amount of substance* is a base unit in SI, like length and time:

mol (a base unit)	mole, unit of amount of substance
m (a base unit)	meter, unit of <i>length</i>
s (a base unit)	second, unit of time
$L = 0.001 \cdot m^3$	liter (volume)
$M = mol \cdot L^{-1}$	molarity (concentration of substance)
$N_A:mol^{-1} \cong 6.022 \times 10^{23}$	Avogadro's number (number of particles per amount of substance)

For a substance X:mol, we write [X]:M for the concentration of X, and  $[X]^{\bullet}:M \cdot s^{-1}$  for the time derivative of the concentration.

A continuous chemical system (C,V) is a system of chemical reactions C plus a vector of initial concentrations  $V_X$ : M, one for each species X. The rates of unary reactions have dimension  $s^{-1}$ . The rates of binary reactions have dimension  $M^{-1}s^{-1}$ . (because in both cases the rhs of an ODE should have dimension  $M^{\cdot s^{-1}}$ ).

For a given volume of solution V, the volumetric factor  $\gamma$  of dimension M<sup>-1</sup> is:

 $\gamma : M^{-1} = N_A V$  where  $N_A$ :mol<sup>-1</sup> and V:L

 $\gamma$ ·[X]: 1 = total number of X molecules (rounded to an integer). #X /  $\gamma$ : M = concentration of X molecules

# The Gillespie<sup>(?)</sup> Conversion

Discrete Chemistry	Continuous Chemistry	$\gamma = N_A V$	:M <sup>-1</sup>
initial quantities $\#A_0$	initial concentration [A] <sub>0</sub>	ns with [A] <sub>0</sub> =#	Α <sub>0</sub> /γ
A ⊶r A'	$A \to^k A'$	with <mark>k = r</mark>	:S <sup>-1</sup>
A+B ⊶• A'+B'	$A + B \rightarrow^k A' + B'$	with <mark>k = rγ</mark>	:M <sup>-1</sup> s <sup>-1</sup>
A+A <b>,</b> r A'+A″	$A+A \rightarrow^k A'+A''$	with <mark>k = rγ/2</mark>	:M <sup>-1</sup> s <sup>-1</sup>

V = interaction volume N<sub>A</sub> = Avogadro's number

Think  $\gamma = 1$ i.e. V = 1/N<sub>A</sub>

# Cont\_{\gamma} and $Disc_{\gamma}$

#### 4.2-3 Definition: Cont<sub>7</sub> and Disc<sub>7</sub>

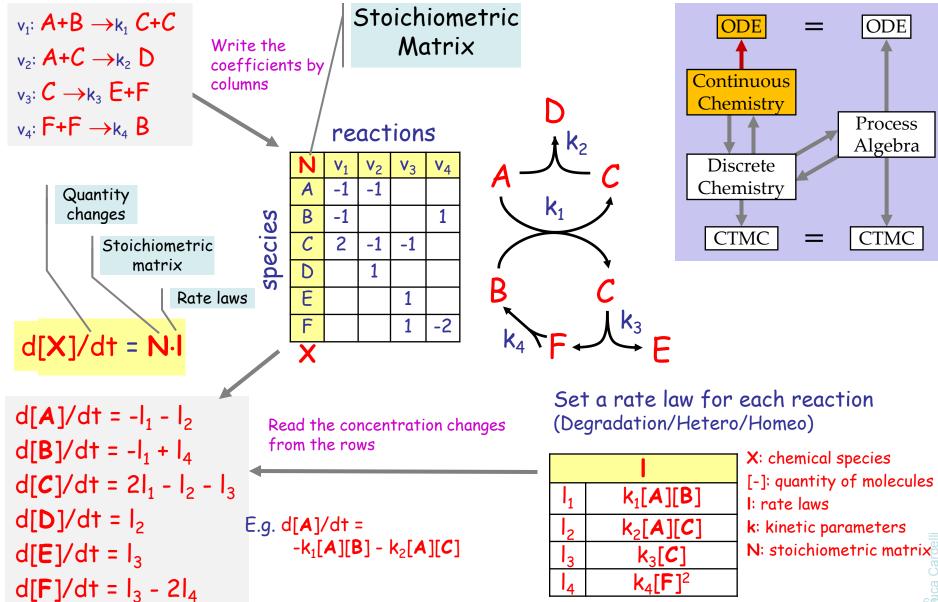

For a volumetric factor  $\gamma:M^{-1}$ , we define a translation  $Cont_{\gamma}$  from a discrete chemical systems (C,P), with species X and initial molecule count  $\#X_0 = \#X(P)$ , to a continuous chemical systems (C,V) with initial concentration  $[X]_0 = V_X$ . The translation  $Disc_{\gamma}$  is its inverse, up to a rounding error  $\lceil \gamma[X]_0 \rceil$  in converting concentrations to molecule counts. Since  $\gamma$  is a global conversion constant, we later usually omit it as a subscript.

$Cont_{\gamma}(X \rightarrow^{r} P)$	$= X \rightarrow^k P$	with $k = r$ ,	r:s <sup>-1</sup>	k:s <sup>-1</sup>
$Cont_{\gamma}(X+Y \rightarrow^{r} P)$	$= X+Y \rightarrow^{k} P$	with $\mathbf{k} = \mathbf{r} \boldsymbol{\gamma}$	r:s <sup>-1</sup>	k:M <sup>-1</sup> s <sup>-1</sup>
$Cont_{\gamma}(X+X \rightarrow^{r} P)$	$= X + X \rightarrow^{k} P$	with $k = r\gamma/2$	r:s <sup>-1</sup>	k:M <sup>-1</sup> s <sup>-1</sup>
$Cont_{\gamma}(\#X_0)$	= [X] <sub>0</sub>	with $[X]_0 = #X_0/\gamma$	X <sub>0</sub> :mol	[X] <sub>0</sub> :M
$Disc_{\gamma}(X \rightarrow^{k} P)$	$= X \rightarrow^{r} P$	with $r = k$ ,	k:s <sup>-1</sup>	r:s <sup>-1</sup>
$Disc_{\gamma}(X+Y \rightarrow^{k} P)$	$= X+Y \rightarrow^{r} P$	with $r = k/\gamma$	k:M <sup>-1</sup> s <sup>-1</sup>	r:s <sup>-1</sup>
$Disc_{\gamma}(X+X \rightarrow^{k} P)$	$= X + X \rightarrow^{r} P$	with $r = 2k/\gamma$	k:M <sup>-1</sup> s <sup>-1</sup>	r:s <sup>-1</sup>
$Disc_{\gamma}([X]_0)$	$= #X_0$	with $\#X_0 = \lceil \gamma[X]_0 \rceil$	$[X]_0:M$	$X_0:mol$

# **Processes Rate Equation**

### Process Rate Equation for Reagents E in volume $\gamma$ d[X]/dt = ( $\Sigma(Y \in E) Accr_E(Y,X) \cdot [Y]$ ) - Depl<sub>E</sub>(X) \cdot [X] for all X \in E

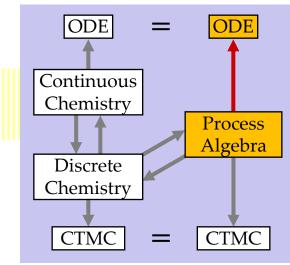

"The change in process concentration (!!) for X at time t is: the sum over all possible (kinds of) processes Y of: the concentration at time t of Y times the accretion from Y to X minus the concentration at time t of X times the depletion of X to some other Y"

 $\text{Depl}_{\text{E}}(X) =$ 

 $\Sigma(i: E.X.i=\tau_{(r)};P) r +$   $\Sigma(i: E.X.i=?a_{(r)};P) r\gamma \cdot OutsOn_{E}(a) +$  $\Sigma(i: E.X.i=!a_{(r)};P) r\gamma \cdot InsOn_{E}(a)$ 

#### Accr<sub>E</sub>(Y, X) = $\Sigma$ (i: E.Y.i= $\tau_{(r)}$ ;P) #X(P)·r + $\Sigma$ (i: E.Y.i= $2a_{(r)}$ ;P) #X(P)·r $\gamma$ ·OutsOn<sub>E</sub>(a) + $\Sigma$ (i: E.Y.i= $1a_{(r)}$ ;P) #X(P)·r $\gamma$ ·InsOn<sub>E</sub>(a)

 $InsOn_{E}(a) = \Sigma(Y \in E) \# \{Y.i \mid E.Y.i=?a_{(r)};P\} \cdot [Y]$  $OutsOn_{E}(a) = \Sigma(Y \in E) \# \{Y.i \mid E.Y.i=!a_{(r)};P\} \cdot [Y]$ 

$$X = \tau_{(r)}; 0 \longrightarrow d[X]/dt = -r[X]$$

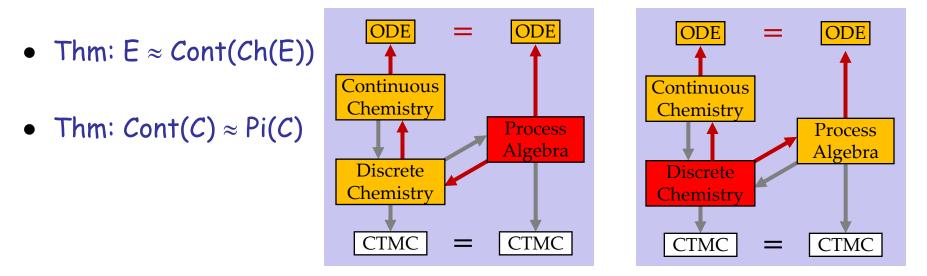

$$X = ?a_{(r)};0 \qquad d[X]/dt = -r\gamma[X][Y]$$
$$d[Y]/dt = -r\gamma[X][Y]$$

$$X = ?a_{(r)}; 0 \longrightarrow d[X]/dt = -2r\gamma[X]^{2}$$

$$\oplus !a_{(r)}; 0$$

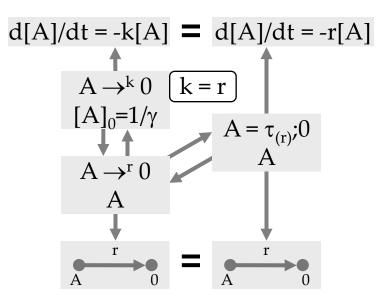

# Continuous State Equivalence

• Def:  $\approx$  is equivalence of polynomials over the field of reals.

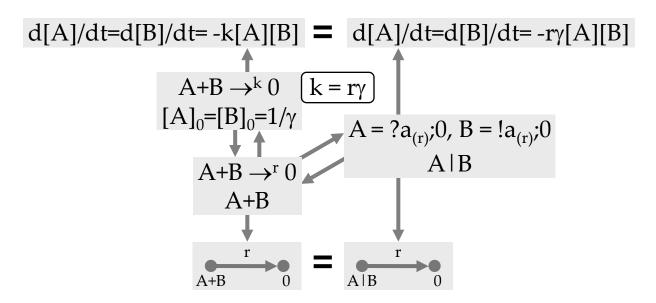

- For each E there is an E'  $\approx$  E that is detangled (E' = Pi(Ch(E)))
- For each E in automata form there is an an E' ≈ E that is detangled and in automata form (E' = Detangle(E)).
